

# Operating characteristics and completeness of the captured-fraction framework

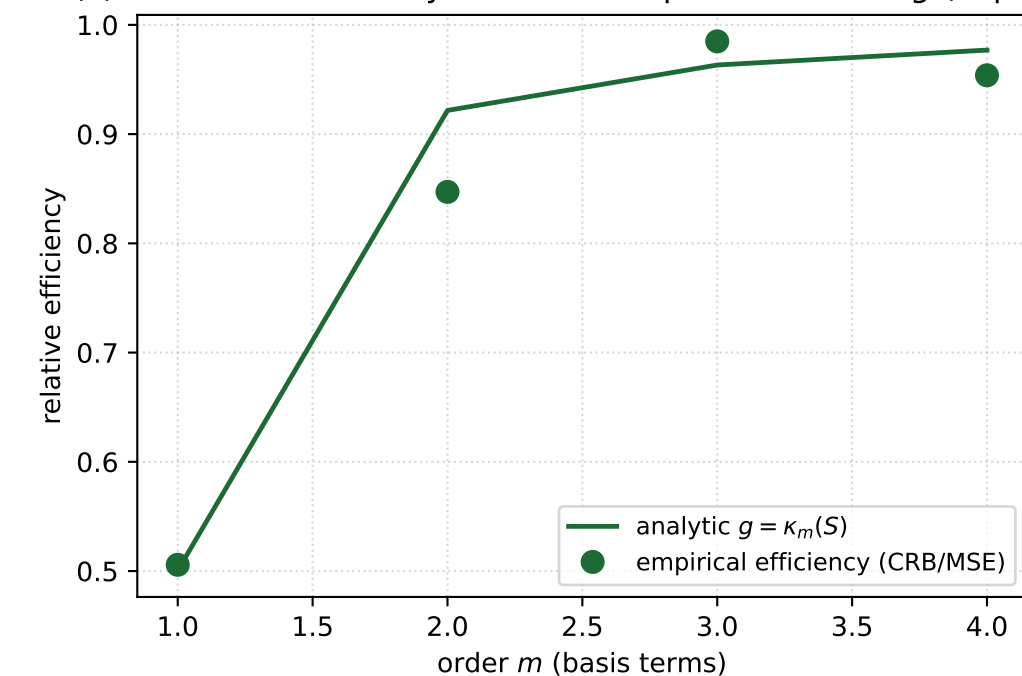

(a) Power rises with order, tracking the captured-fraction theory

(b) ROC of the order- $m$  projected-score test (Laplace)

(c) Estimator efficiency tracks the captured fraction  $g$  (Laplace)

(d) Completeness:  $\kappa_m(z) \rightarrow 1$  as exponents densify in  $(0, \alpha/2)$
